

Introduction to Artificial Intelligence

Lecture: Basic Machine Learning

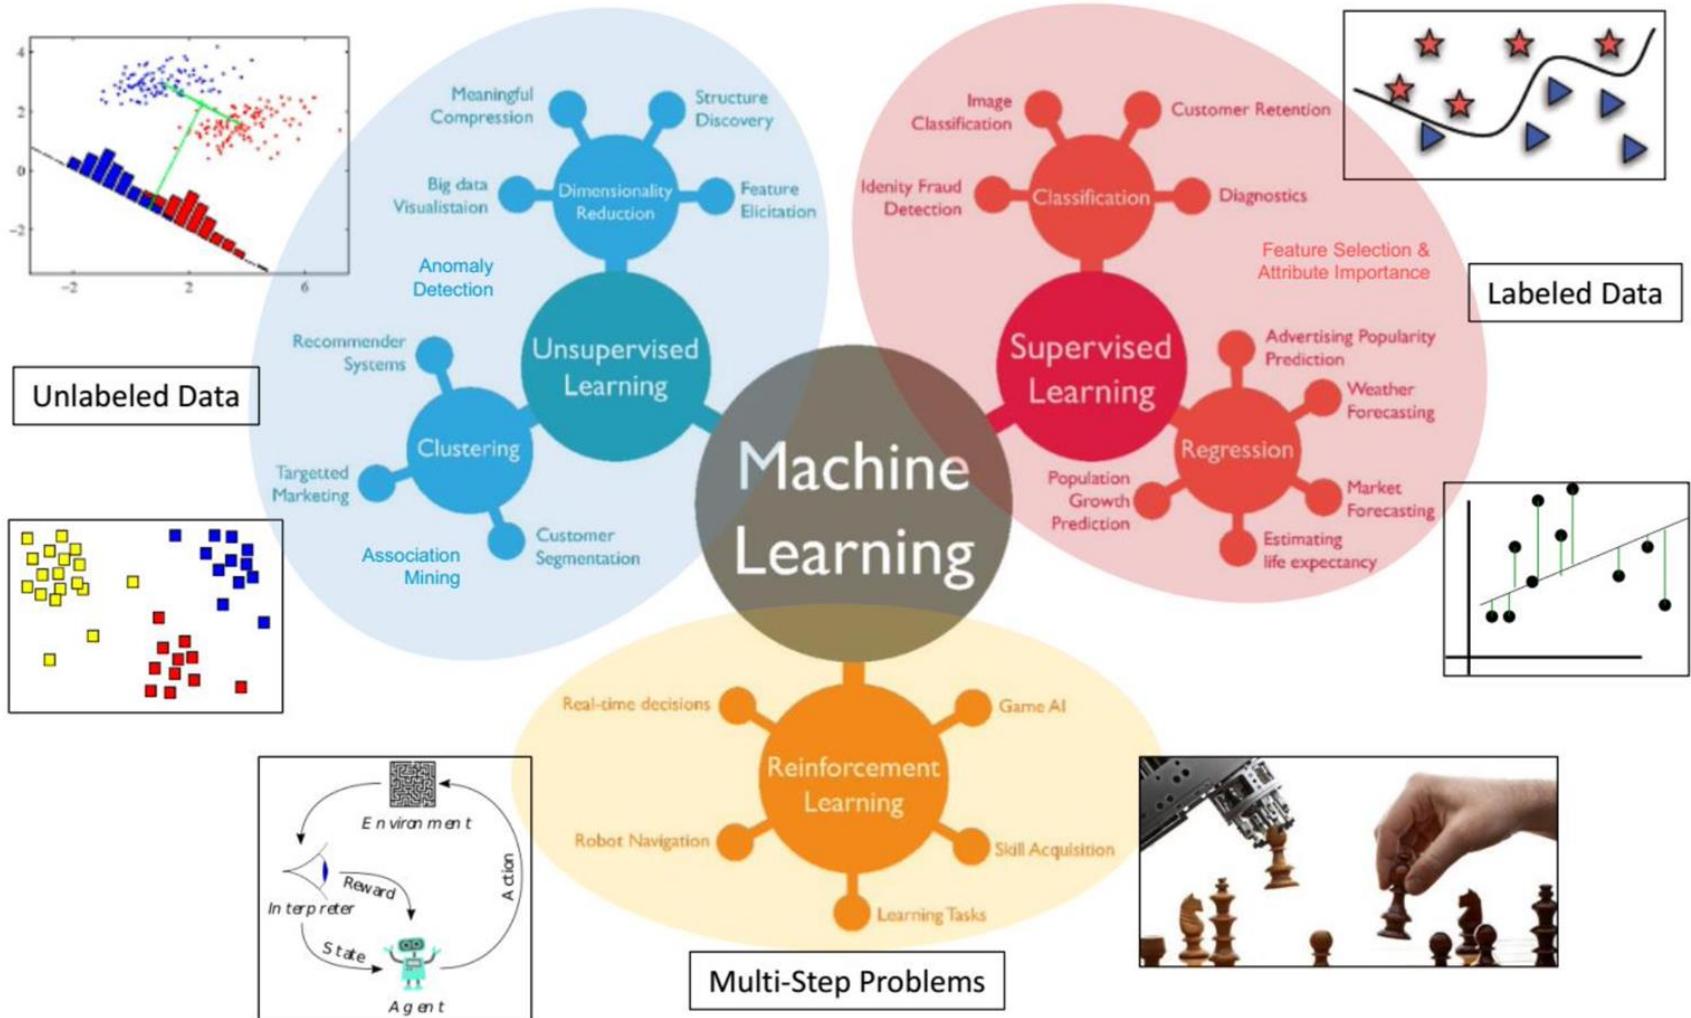

Outline

- Introduction to Machine Learning
- ID3 Decision Tree Learning
- Naïve Bayesian Learning

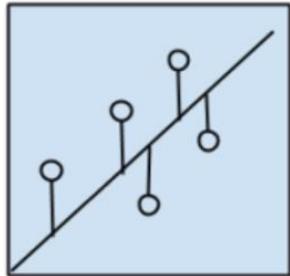

Machine Learning

- Machine learning involves adaptive mechanisms that enable computers to learn from experience, learn by example and learn by analogy.

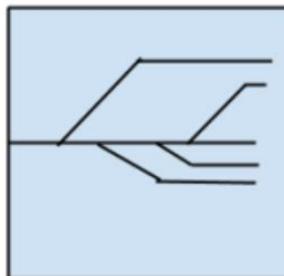

Machine Learning

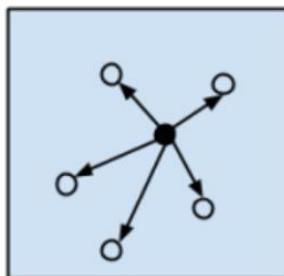

Machine Learning

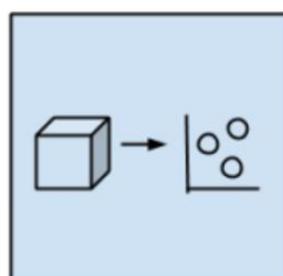

Regression Algorithms

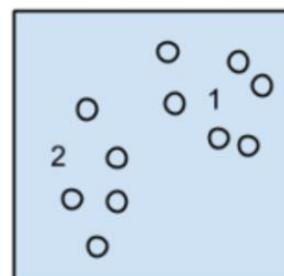

Regularization Algorithms

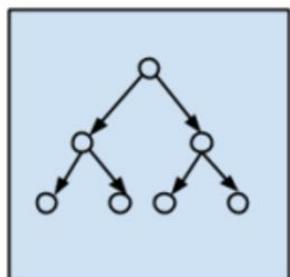

Instance-based Algorithms

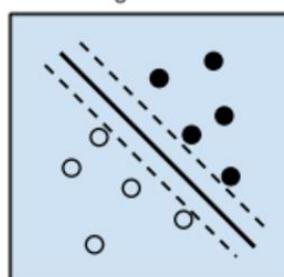

Dimensional Reduction Algorithms

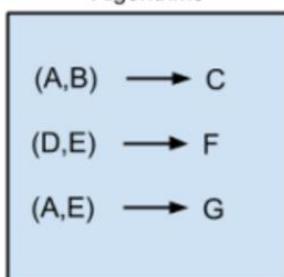

Clustering Algorithms

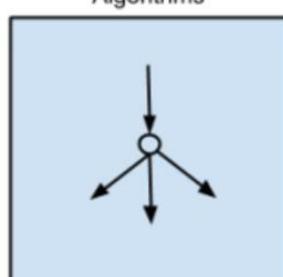

Decision Tree Algorithms

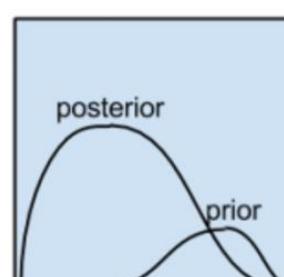

Support Vector Machines

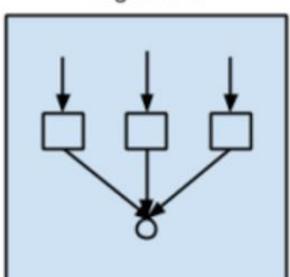

Association Rule Learning Algorithms

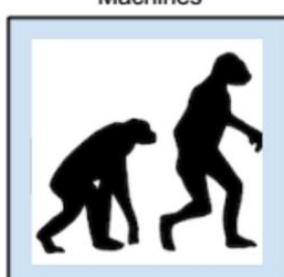

Artificial Neural Network Algorithms

Bayesian Algorithms

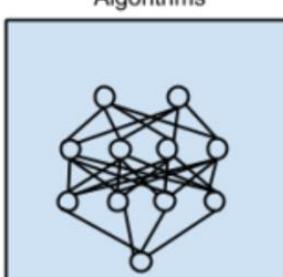

Ensemble Algorithms

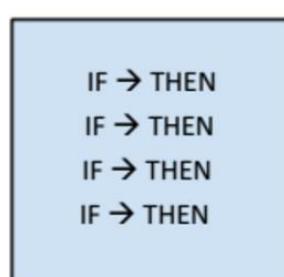

Evolutionary Algorithms

Non-exhaustive
list of ML families

Deep Learning Algorithms

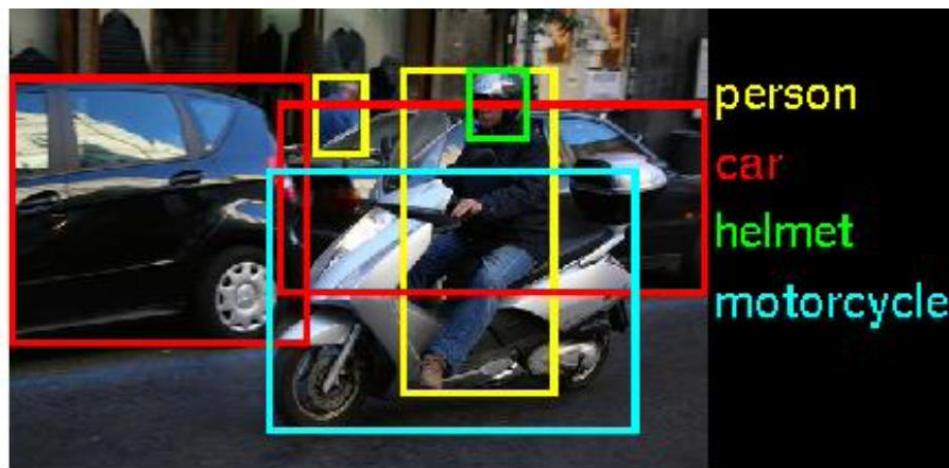

Learning Classifier Systems

Supervised learning

- Learn a function that maps an input to an output based on example input-output pairs.
- Example,
 - Spam detection: Decide which emails are spam and which are important
 - Object detection and recognition: Localize and identify instances of semantic objects of a certain class (e.g., humans, buildings, or cars) in digital images and videos.

Supervised learning

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

Classification vs. Regression

- Classification
 - Train a model to predict a categorical dependent variable
 - Case studies: predicting disease, classifying images, predicting customer churn, buy or won't buy, etc.
 - Binary classification vs. Multiclass classification vs. Multilabel classification
- Regression
 - Train a model to predict a continuous dependent variable
 - Case studies: predicting height of children, predicting sales, forecasting stock prices, etc.

Unsupervised learning

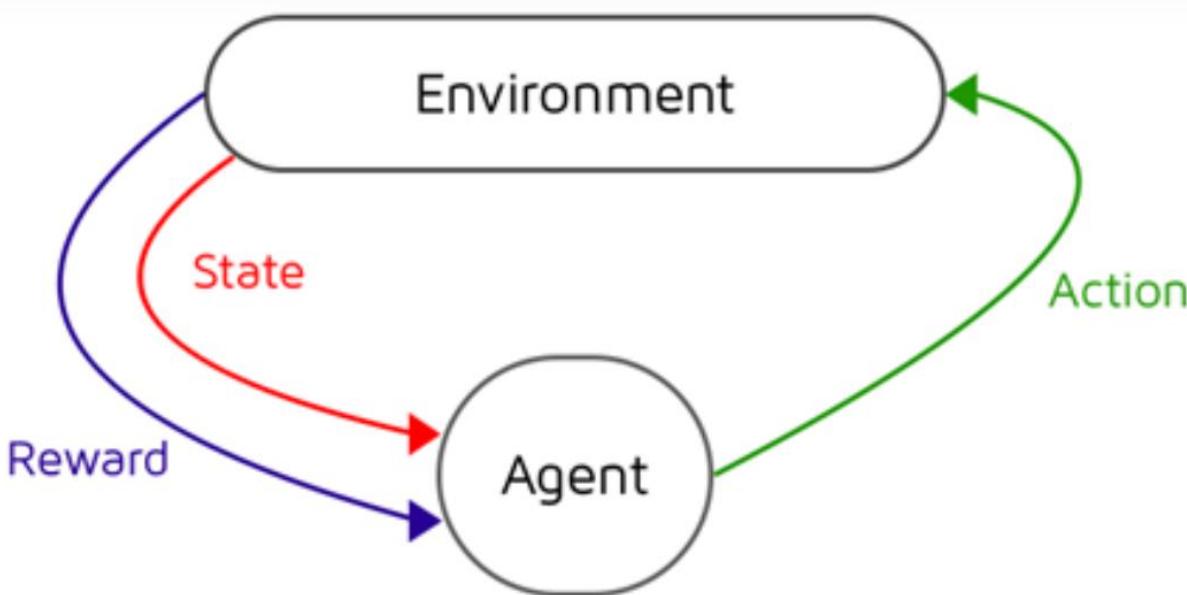

- Infer a function to describe hidden structure from "unlabeled" data.
- Example,
 - Social network analysis: cluster users of social networks by interest (community detection)

Semi-supervised learning

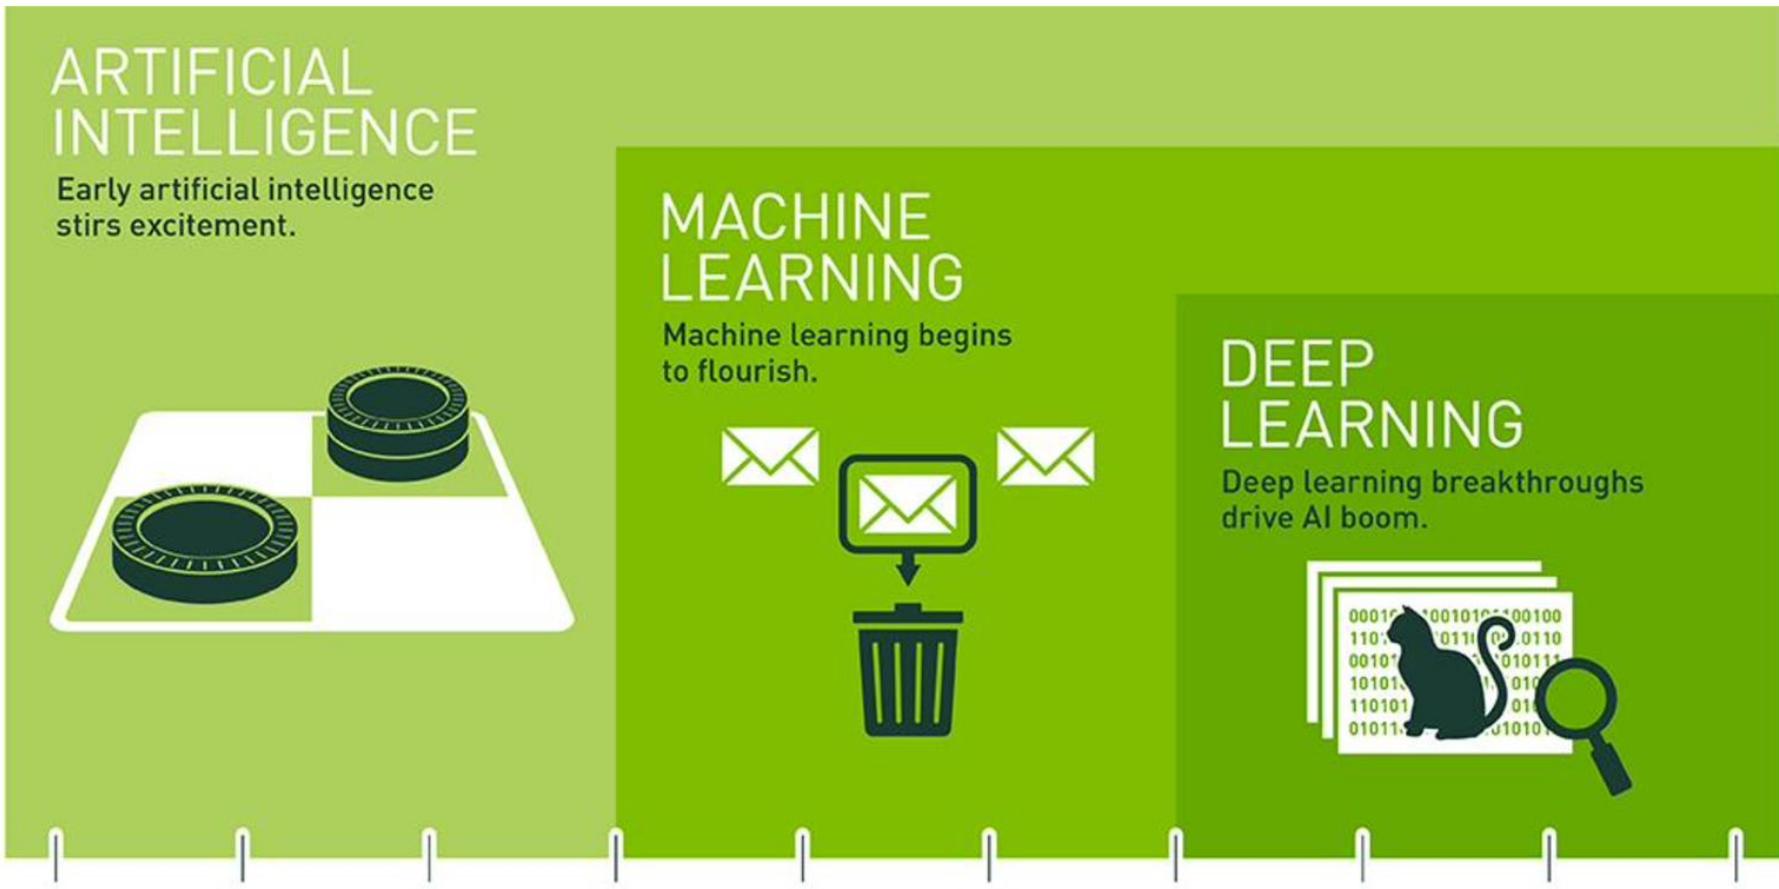

- The model is initially trained with a small amount of labeled data and a large amount of unlabeled data.

Reinforcement learning

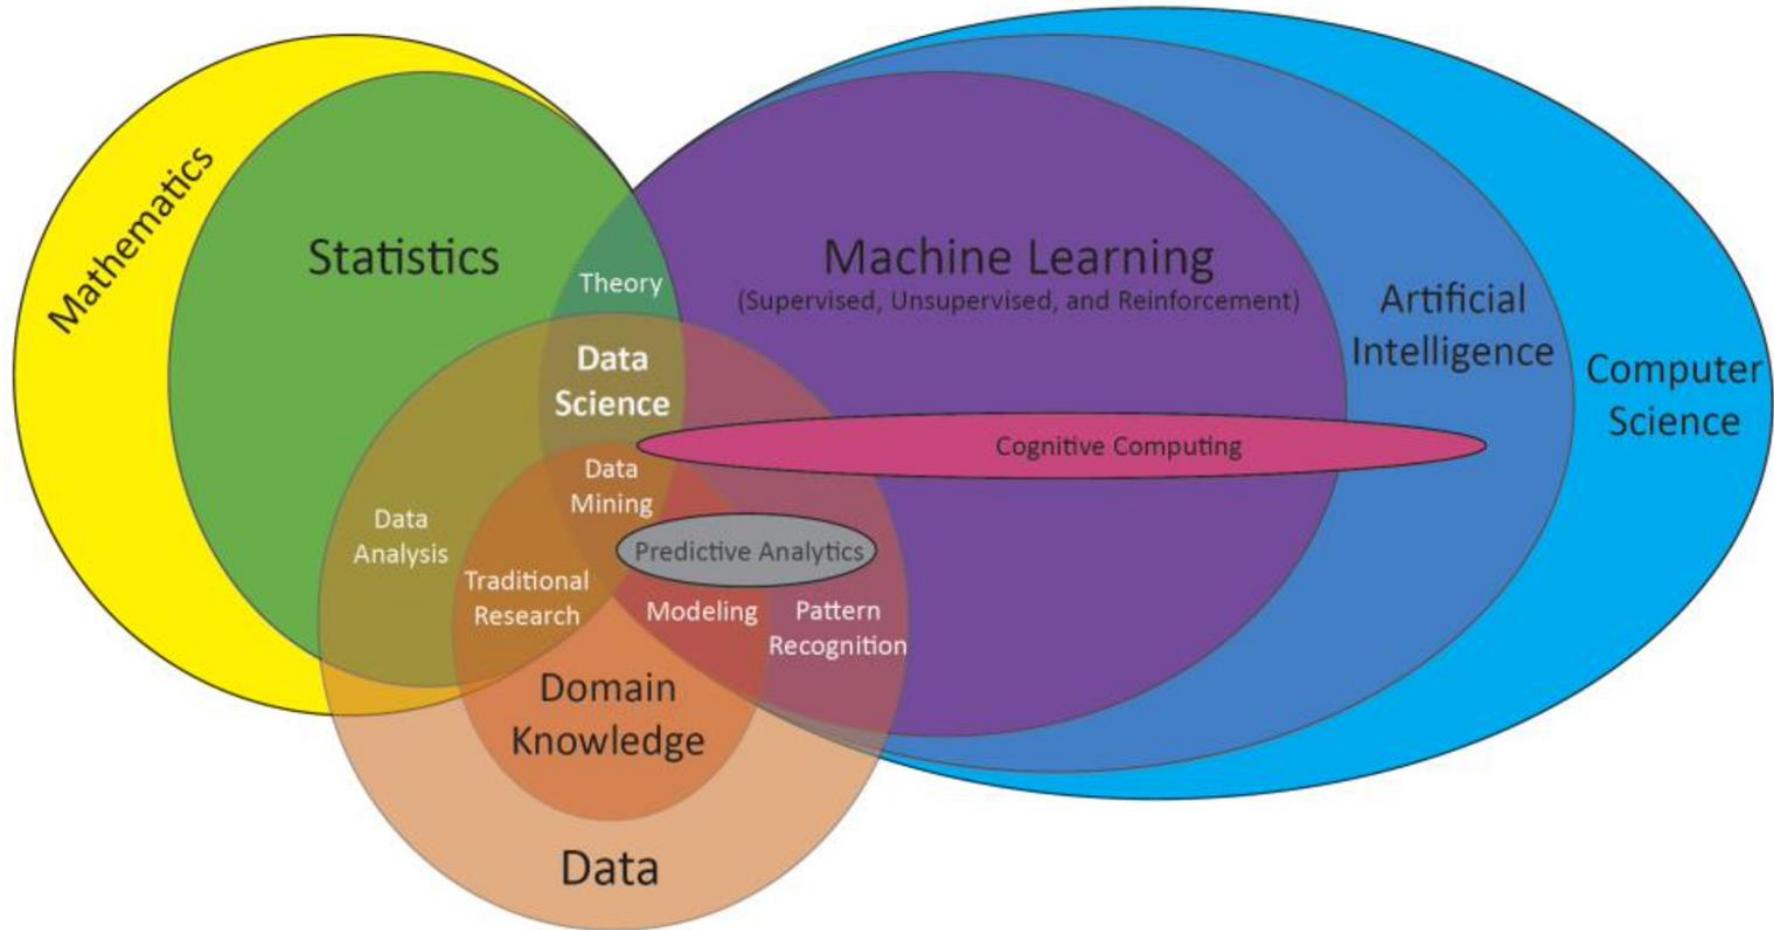

- The agent learns from the environment by interacting with it and receives rewards for performing actions.

Machine Learning

Machine Learning

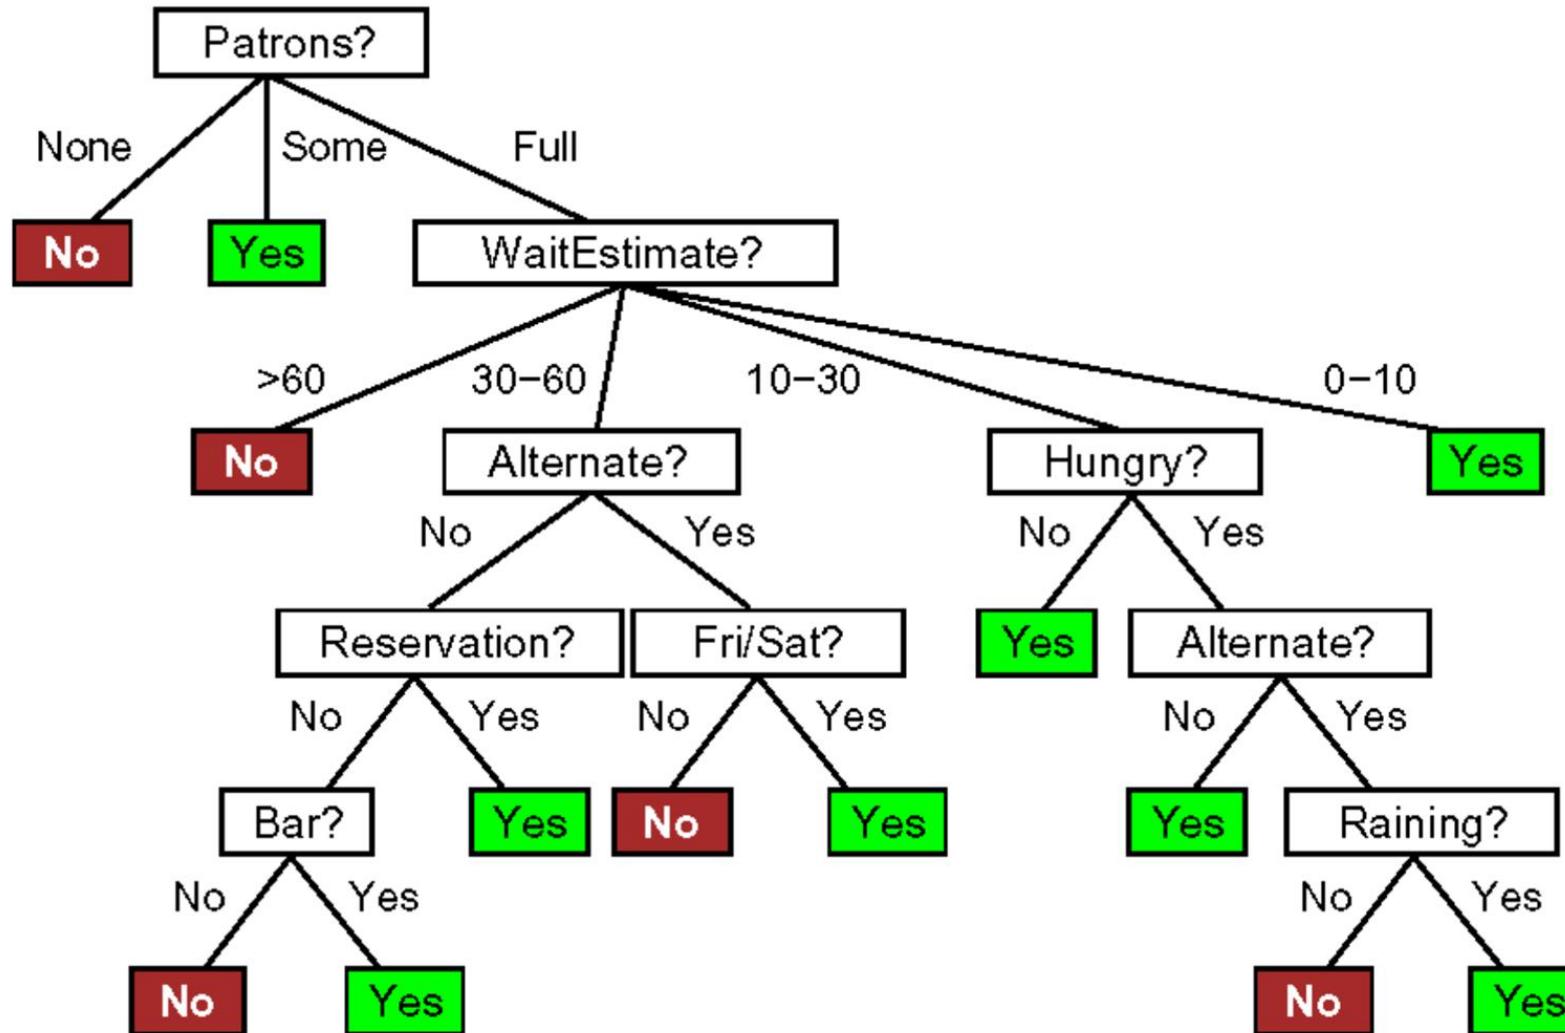

ID3 Decision Tree Learning

- The decision is based on the following attributes
 1. Alternate: is there an alternative restaurant nearby?
 2. Bar: is there a comfortable bar area to wait in?
 3. Fri/Sat: is today Friday or Saturday?
 4. Hungry: are we hungry?
 5. Patrons: number of people in the restaurant (None, Some, Full)
 6. Price: price range (\$, \$\$, \$\$\$)
 7. Raining: is it raining outside?
 8. Reservation: have we made a reservation?
 9. Type: kind of restaurant (French, Italian, Thai, Burger)
 10. WaitEstimate: estimated waiting time (0-10, 10-30, 30-60, >60)

ID3 Decision Tree Learning

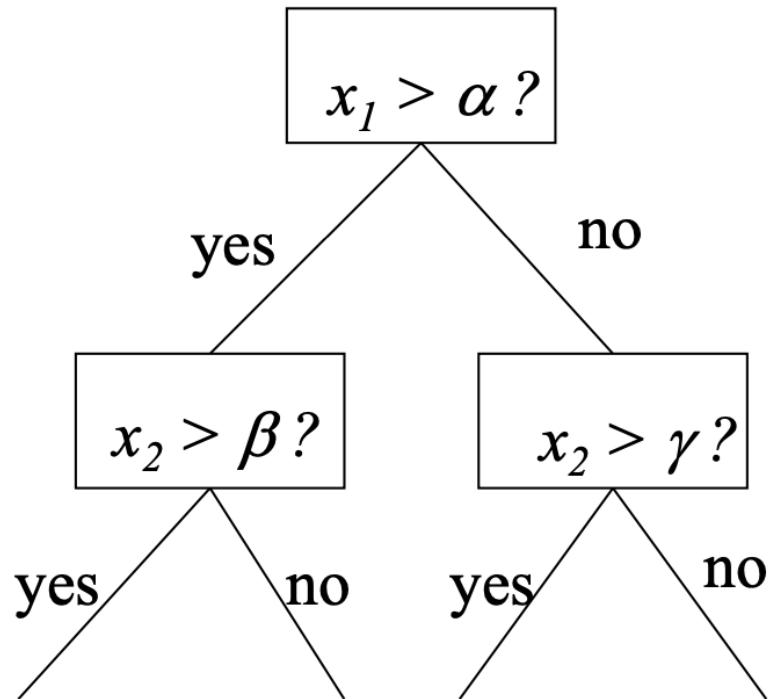

| Example | Attributes | | | | | | | | | | Target <i>WillWait</i> |
|------------------------|------------|------------|------------|------------|-------------|---------------|-------------|------------|----------------|---------------|---------------------------|
| | <i>Alt</i> | <i>Bar</i> | <i>Fri</i> | <i>Hun</i> | <i>Pat</i> | <i>Price</i> | <i>Rain</i> | <i>Res</i> | <i>Type</i> | <i>Est</i> | |
| <i>X</i> ₁ | <i>T</i> | <i>F</i> | <i>F</i> | <i>T</i> | <i>Some</i> | <i>\$\$\$</i> | <i>F</i> | <i>T</i> | <i>French</i> | <i>0–10</i> | <i>T</i> |
| <i>X</i> ₂ | <i>T</i> | <i>F</i> | <i>F</i> | <i>T</i> | <i>Full</i> | <i>\$</i> | <i>F</i> | <i>F</i> | <i>Thai</i> | <i>30–60</i> | <i>F</i> |
| <i>X</i> ₃ | <i>F</i> | <i>T</i> | <i>F</i> | <i>F</i> | <i>Some</i> | <i>\$</i> | <i>F</i> | <i>F</i> | <i>Burger</i> | <i>0–10</i> | <i>T</i> |
| <i>X</i> ₄ | <i>T</i> | <i>F</i> | <i>T</i> | <i>T</i> | <i>Full</i> | <i>\$</i> | <i>F</i> | <i>F</i> | <i>Thai</i> | <i>10–30</i> | <i>T</i> |
| <i>X</i> ₅ | <i>T</i> | <i>F</i> | <i>T</i> | <i>F</i> | <i>Full</i> | <i>\$\$\$</i> | <i>F</i> | <i>T</i> | <i>French</i> | <i>>60</i> | <i>F</i> |
| <i>X</i> ₆ | <i>F</i> | <i>T</i> | <i>F</i> | <i>T</i> | <i>Some</i> | <i>\$\$</i> | <i>T</i> | <i>T</i> | <i>Italian</i> | <i>0–10</i> | <i>T</i> |
| <i>X</i> ₇ | <i>F</i> | <i>T</i> | <i>F</i> | <i>F</i> | <i>None</i> | <i>\$</i> | <i>T</i> | <i>F</i> | <i>Burger</i> | <i>0–10</i> | <i>F</i> |
| <i>X</i> ₈ | <i>F</i> | <i>F</i> | <i>F</i> | <i>T</i> | <i>Some</i> | <i>\$\$</i> | <i>T</i> | <i>T</i> | <i>Thai</i> | <i>0–10</i> | <i>T</i> |
| <i>X</i> ₉ | <i>F</i> | <i>T</i> | <i>T</i> | <i>F</i> | <i>Full</i> | <i>\$</i> | <i>T</i> | <i>F</i> | <i>Burger</i> | <i>>60</i> | <i>F</i> |
| <i>X</i> ₁₀ | <i>T</i> | <i>T</i> | <i>T</i> | <i>T</i> | <i>Full</i> | <i>\$\$\$</i> | <i>F</i> | <i>T</i> | <i>Italian</i> | <i>10–30</i> | <i>F</i> |
| <i>X</i> ₁₁ | <i>F</i> | <i>F</i> | <i>F</i> | <i>F</i> | <i>None</i> | <i>\$</i> | <i>F</i> | <i>F</i> | <i>Thai</i> | <i>0–10</i> | <i>F</i> |
| <i>X</i> ₁₂ | <i>T</i> | <i>T</i> | <i>T</i> | <i>T</i> | <i>Full</i> | <i>\$</i> | <i>F</i> | <i>F</i> | <i>Burger</i> | <i>30–60</i> | <i>T</i> |

ID3 Decision Tree Learning

ID3 Decision Tree

- Divide and conquer: Split data into smaller and smaller subsets
- Splits usually on a single variable

ID3 Decision Tree

- The remaining examples are all positive (or all negative)
→ DONE, it is possible to answer Yes or No
- There are some positive and some negative examples
→ choose the “best” attribute to split them
- No examples left at a branch
→ return a default value
- No attributes left but both positive and negative examples
→ return the plurality classification of remaining ones.

ID3 Decision Tree

```
function DECISION-TREE-LEARNING (examples, attributes, parent examples)
  returns a tree
  if examples is empty
    then return PLURALITY-VALUE(parent examples)
  else if all examples have the same classification
    then return the classification
  else if attributes is empty
    then return PLURALITY-VALUE(examples)
  else
     $A \leftarrow \operatorname{argmax}_{a \in \text{attributes}} \text{IMPORTANCE}(a, \text{examples})$ 
    tree  $\leftarrow$  a new decision tree with root test A
    for each value  $v_k$  of A do
       $exs \leftarrow \{e: e \in \text{examples} \text{ and } e.A = v_k\}$ 
      subtree  $\leftarrow$  DECISION-TREE-LEARNING(exs, attributes-A, examples)
      add a branch to tree with label (A =  $v_k$ ) and subtree subtree
  return tree
```

A purity measure with entropy

- Entropy is a measure of the uncertainty of a random variable V with values v_k .

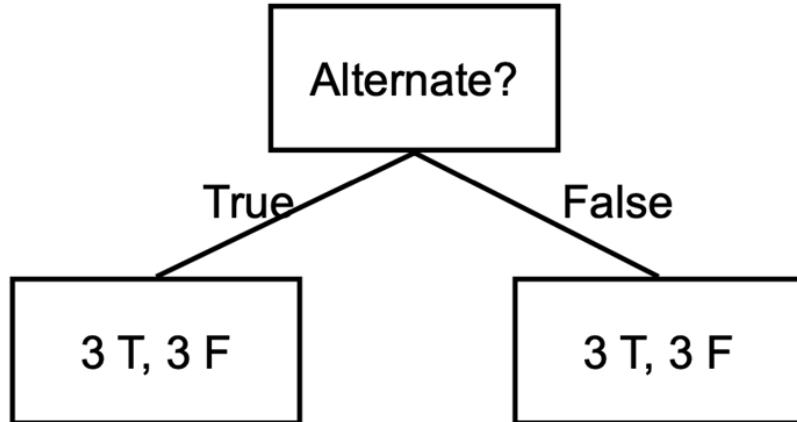

$$H(V) = \sum_k P(v_k) \log_2 \frac{1}{P(v_k)} = - \sum_k P(v_k) \log_2 P(v_k)$$

- v_k is a class in V (e.g., yes/no in binary classification)
- $P(v_k)$ is the proportion of the number of elements in class v_k to the number of elements in V .

A purity measure with entropy

- Entropy is maximal when all possibilities are equally likely.
- Entropy is zero in a pure “yes” (or pure “no”) node.
- Decision tree aims to decrease the entropy in each node.

Average Entropy

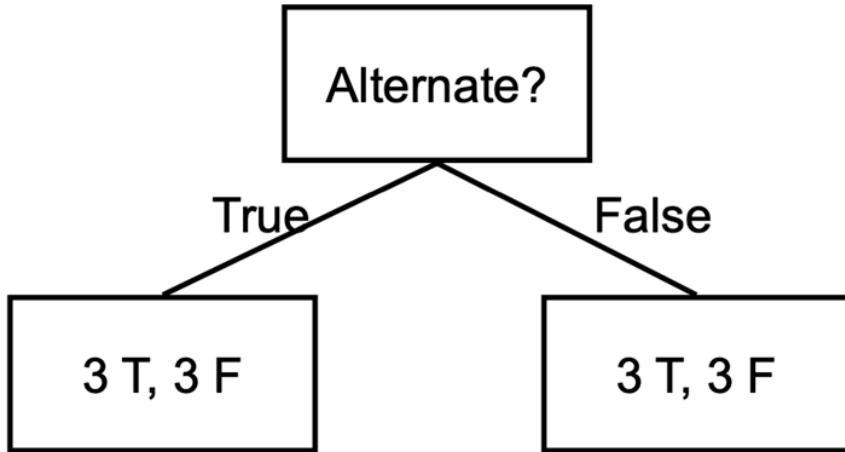

| Example | Attributes | | | | | | | | | | Target WillWait |
|-----------------|------------|-----|-----|-----|------|--------|------|-----|---------|-------|--------------------|
| | Alt | Bar | Fri | Hun | Pat | Price | Rain | Res | Type | Est | |
| X ₁ | T | F | F | T | Some | \$\$\$ | F | T | French | 0-10 | T |
| X ₂ | T | F | F | T | Full | \$ | F | F | Thai | 30-60 | F |
| X ₃ | F | T | F | F | Some | \$ | F | F | Burger | 0-10 | T |
| X ₄ | T | F | T | T | Full | \$ | F | F | Thai | 10-30 | T |
| X ₅ | T | F | T | F | Full | \$\$\$ | F | T | French | >60 | F |
| X ₆ | F | T | F | T | Some | \$\$ | T | T | Italian | 0-10 | T |
| X ₇ | F | T | F | F | None | \$ | T | F | Burger | 0-10 | F |
| X ₈ | F | F | F | T | Some | \$\$ | T | T | Thai | 0-10 | T |
| X ₉ | F | T | T | F | Full | \$ | T | F | Burger | >60 | F |
| X ₁₀ | T | T | T | T | Full | \$\$\$ | F | T | Italian | 10-30 | F |
| X ₁₁ | F | F | F | F | None | \$ | F | F | Thai | 0-10 | F |
| X ₁₂ | T | T | T | T | Full | \$ | F | F | Burger | 30-60 | T |

- Calculate **Average Entropy** of attribute **Alternate**

$$AE_{Alternate} = P(Alt = \textcolor{blue}{T}) \times H(Alt = \textcolor{blue}{T}) + P(Alt = \textcolor{red}{F}) \times H(Alt = \textcolor{red}{F})$$

$$AE_{Alternate} = \frac{6}{12} \left[-\left(\frac{3}{6} \log_2 \frac{3}{6} \right) - \left(\frac{3}{6} \log_2 \frac{3}{6} \right) \right] + \frac{6}{12} \left[-\left(\frac{3}{6} \log_2 \frac{3}{6} \right) - \left(\frac{3}{6} \log_2 \frac{3}{6} \right) \right] = 1$$

Information Gain

| Example | Attributes | | | | | | | | | | Target WillWait |
|-----------------|------------|-----|-----|-----|------|--------|------|-----|---------|-------|--------------------|
| | Alt | Bar | Fri | Hun | Pat | Price | Rain | Res | Type | Est | |
| X ₁ | T | F | F | T | Some | \$\$\$ | F | T | French | 0–10 | T |
| X ₂ | T | F | F | T | Full | \$ | F | F | Thai | 30–60 | F |
| X ₃ | F | T | F | F | Some | \$ | F | F | Burger | 0–10 | T |
| X ₄ | T | F | T | T | Full | \$ | F | F | Thai | 10–30 | T |
| X ₅ | T | F | T | F | Full | \$\$\$ | F | T | French | >60 | F |
| X ₆ | F | T | F | T | Some | \$\$ | T | T | Italian | 0–10 | T |
| X ₇ | F | T | F | F | None | \$ | T | F | Burger | 0–10 | F |
| X ₈ | F | F | F | T | Some | \$\$ | T | T | Thai | 0–10 | T |
| X ₉ | F | T | T | F | Full | \$ | T | F | Burger | >60 | F |
| X ₁₀ | T | T | T | T | Full | \$\$\$ | F | T | Italian | 10–30 | F |
| X ₁₁ | F | F | F | F | None | \$ | F | F | Thai | 0–10 | F |
| X ₁₂ | T | T | T | T | Full | \$ | F | F | Burger | 30–60 | T |

- **Information Gain** is the difference in entropy from before to after the set S is split on the selected attribute.

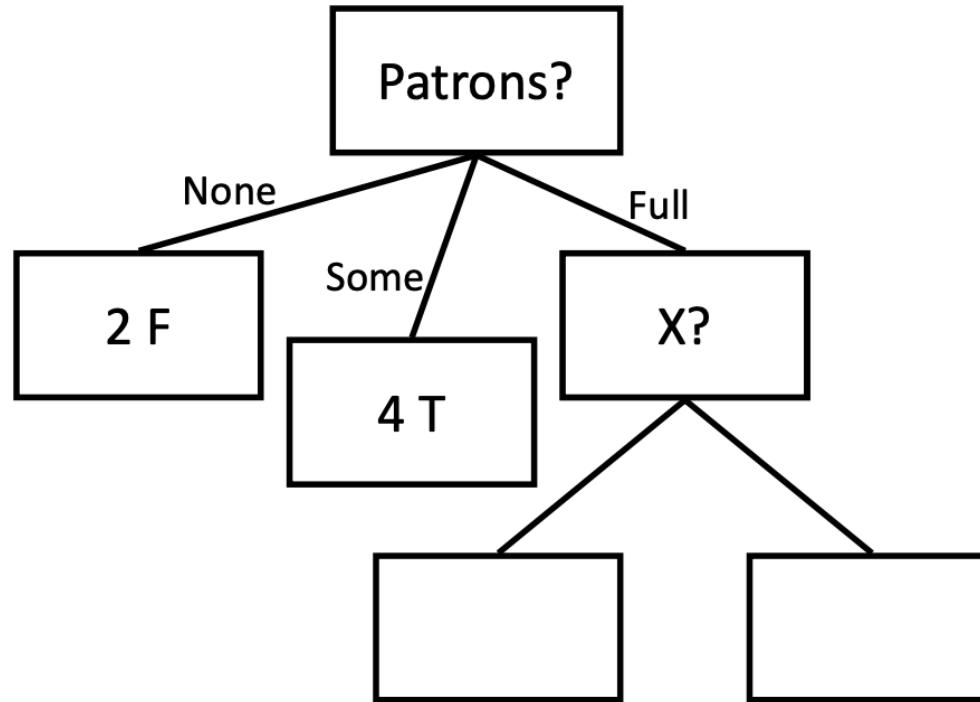

$$IG(Alternate, S) = H(S) - AE_{Alternate} = 1 - 1 = 0$$

Information Gain

- $IG(\text{Alternate}, S) = 0$
- $IG(\text{Bar}, S) = 0$
- $IG(\text{Sat/Fri?}, S) = 0.021$
- $IG(\text{Hungry}, S) = 0.196$
- $IG(\text{Raining}, S) = 0$
- $IG(\text{Reservation}, S) = 0.021$
- $IG(\text{Patron}, S) = 0.541$
- $IG(\text{Price}, S) = 0.23$
- $IG(\text{Type}, S) = 0$
- $IG(\text{Est. waiting time}, S) = 0.208$

Decision Tree Learning

- Largest Information Gain (0.541) / Smallest Entropy (0.459) achieved by splitting on Patrons.

Homework

| No. | Writable | Updated | Size | Class |
|-----|----------|---------|-------|----------|
| 1 | Yes | No | Small | Infected |
| 2 | Yes | Yes | Large | Infected |
| 3 | No | Yes | Med | Infected |
| 4 | No | No | Med | Clean |
| 5 | Yes | No | Large | Clean |
| 6 | No | No | Large | Clean |

Homework

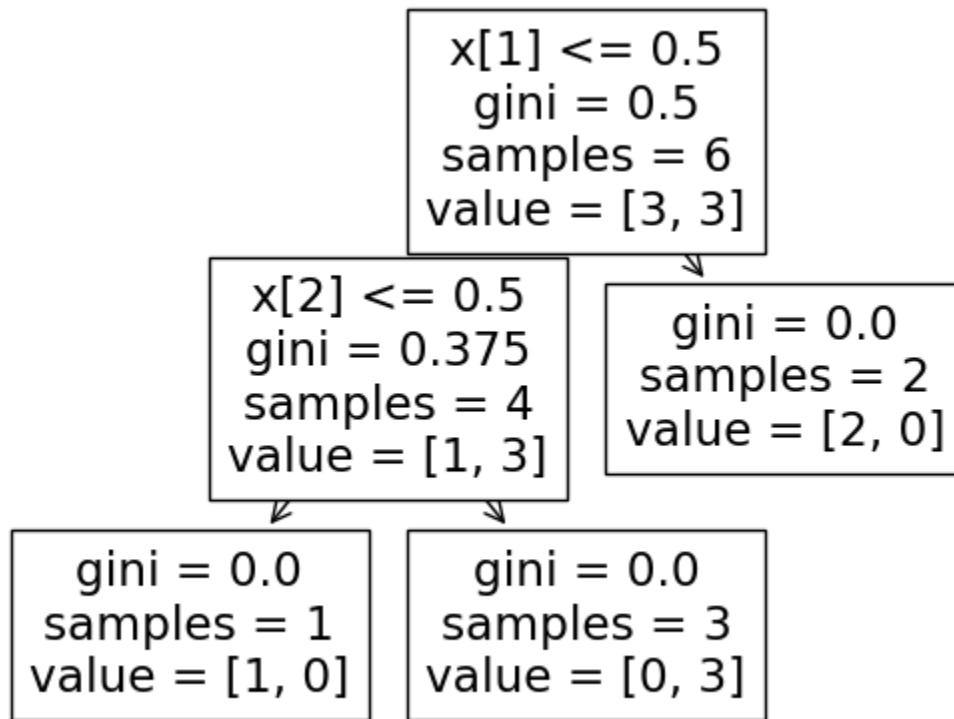

```
from sklearn.tree import DecisionTreeClassifier, plot_tree
import pandas as pd

df = pd.DataFrame(
    [ {'W':1, 'U':0, 'S':0, 'L':0},
      {'W':1, 'U':1, 'S':2, 'L':0},
      {'W':0, 'U':1, 'S':1, 'L':0},
      {'W':0, 'U':0, 'S':1, 'L':1},
      {'W':1, 'U':0, 'S':2, 'L':1},
      {'W':0, 'U':0, 'S':2, 'L':1},
    ]
)

clf = DecisionTreeClassifier()
clf.fit(df[['W', 'U', 'S']], df['L'])

plot_tree(clf)
```

Homework

Bayesian classification

- A statistical classifier performs probabilistic prediction, i.e., predicts class membership probabilities
 - Foundation: Based on Bayes' Theorem

$$P(c|x) = \frac{P(x|c)P(c)}{P(x)}$$

Likelihood Class Prior Probability
↓ ↑
Posterior Probability Predictor Prior Probability

$$P(c | X) = P(x_1 | c) \times P(x_2 | c) \times \cdots \times P(x_n | c) \times P(c)$$

The Bayes' Theorem

- Total Probability Theorem:

$$P(B) = \sum_{i=1}^M P(B|A_i)P(A_i)$$

- Let \mathbf{X} be a data sample (“evidence”) with unknown class label and H be a hypothesis that \mathbf{X} belongs to class C .
- Bayes’ Theorem:

$$\mathbf{P}(H | \mathbf{X}) = \frac{\mathbf{P}(\mathbf{X} | H)\mathbf{P}(H)}{\mathbf{P}(\mathbf{X})}$$

- Classification is to determine $P(H | \mathbf{X})$, i.e. the probability that the hypothesis H holds given the observed data sample \mathbf{X} .

Example data set

| age | income | student | credit_rating | buys_computer |
|---------|--------|---------|---------------|---------------|
| <=30 | high | no | fair | no |
| <=30 | high | no | excellent | no |
| 31...40 | high | no | fair | yes |
| >40 | medium | no | fair | yes |
| >40 | low | yes | fair | yes |
| >40 | low | yes | excellent | no |
| 31...40 | low | yes | excellent | yes |
| <=30 | medium | no | fair | no |
| <=30 | low | yes | fair | yes |
| >40 | medium | yes | fair | yes |
| <=30 | medium | yes | excellent | yes |
| 31...40 | medium | no | excellent | yes |
| 31...40 | high | yes | fair | yes |
| >40 | medium | no | excellent | no |

The Bayes' Theorem

- $P(H)$ (prior probability): the initial probability
 - E.g., X will buy computer, regardless of age, income, ...
- $P(X)$: the probability that sample data is observed
 - E.g., X is 31..40 and has a medium income, regardless of the buying
- $P(X | H)$ (likelihood): the probability of observing the sample X , given that the hypothesis holds
 - E.g., Given that X will buy computer, the probability that X is 31..40 and has a medium income

$$P(H | X) = \frac{P(X | H)P(H)}{P(X)}$$

- E.g., given that X is 31..40 and has a medium income, the probability that X will buy computer

The Bayes' Theorem

- Informally,

$$P(H \mid \mathbf{X}) = \frac{P(\mathbf{X} \mid H)P(H)}{P(\mathbf{X})}$$

*posteriori = likelihood * prior / evidence*

- \mathbf{X} belongs to C_i iff the probability $P(C_i \mid \mathbf{X})$ is the highest among all the $P(C_k \mid \mathbf{X})$ for all the k classes.

Classification with Bayes' Theorem

- Let D be a training set of tuples and associated class labels
- Each tuple is represented by a n -attribute $\mathbf{X} = (x_1, x_2, \dots, x_n)$
- Suppose there are m classes C_1, C_2, \dots, C_m
- Classification is to derive the maximum posteriori $P(C_i | \mathbf{X})$ from Bayes' theorem

$$P(C_i | \mathbf{X}) = \frac{P(\mathbf{X} | C_i)P(C_i)}{P(\mathbf{X})}$$

- $P(X)$ is constant for all classes, only $P(\mathbf{X}|C_i)P(C_i)$ needs to be maximized.

Naïve Bayesian classifier

- Class-conditional independence: There are no dependence relationships among the attributes.
- The naïve Bayesian classification formula is written as

$$P(\mathbf{X} | C_i) = \prod_{k=1}^n P(x_k | C_i) = P(x_1 | C_i) \times P(x_2 | C_i) \times \cdots \times P(x_n | C_i)$$

A_k is categorical: $P(x_k | C_i)$ is the number of tuples in C_i having value x_k for A_k divided by $|C_{i,D}|$ (# of tuples of C_i in D)

A_k is continuous: $P(x_k | C_i) = g(x_k, \mu_{C_i}, \sigma_{C_i})$ with the Gaussian

$$\text{distribution } g(x, \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

Naive Bayesian for the example dataset

| | |
|---|------|
| $P(\text{buys_computer} = \text{"yes"})$ | 9/14 |
| $P(\text{buys_computer} = \text{"no"})$ | 5/14 |

| | $\text{buys_computer} = \text{"yes"}$ | $\text{buys_computer} = \text{"no"}$ |
|------------------------------------|--|---------------------------------------|
| age = “<=30” | 2/9 | 3/5 |
| age = “31...40” | 4/9 | 0/5 |
| age = “>40” | 3/9 | 2/5 |
| income = “low” | 3/9 | 1/5 |
| income = “medium” | 4/9 | 2/5 |
| income = “high” | 2/9 | 2/5 |
| student = “yes” | 6/9 | 1/5 |
| student = “no” | 3/9 | 4/5 |
| credit_rating = “fair” | 6/9 | 2/5 |
| credit_rating = “excellent” | 3/9 | 3/5 |

Naive Bayesian for the example dataset

| age | income | student | credit_rating | buys_computer |
|------|--------|---------|---------------|---------------|
| <=30 | medium | yes | fair | ? |

- $P(\mathbf{X} | C_i)$
 - $P(\mathbf{X} | \text{buys_computer} = \text{"yes"}) = 2/9 * 4/9 * 6/9 * 6/9 = 0.044$
 - $P(\mathbf{X} | \text{buys_computer} = \text{"no"}) = 3/5 * 2/5 * 1/5 * 2/5 = 0.019$
- $P(\mathbf{X} | C_i) * P(C_i)$
 - $P(\mathbf{X} | \text{buys_computer} = \text{"yes"}) * P(\text{buys_computer} = \text{"yes"}) = 0.028$
 - $P(\mathbf{X} | \text{buys_computer} = \text{"no"}) * P(\text{buys_computer} = \text{"no"}) = 0.007$
- $P(C_i | \mathbf{X})$
 - $P(\text{buys_computer} = \text{"yes"} | \mathbf{X}) = 0.8$
 - $P(\text{buys_computer} = \text{"no"} | \mathbf{X}) = 0.2$

Therefore, X belongs to class (“buys_computer = yes”)

Avoiding the zero-probability problem

The naïve Bayesian prediction requires each conditional probability be **non-zero**.

$$P(\mathbf{X} | C_i) = \prod_{k=1}^n P(x_k | C_i)$$

Otherwise, the predicted probability will be zero

For example,

| age | income | student | credit_rating | buys_computer |
|---------|--------|---------|---------------|---------------|
| 31...40 | medium | yes | fair | ? |

$$P(\mathbf{X} | \text{buys_computer} = \text{"no"}) = 0 * 2/5 * 1/5 * 2/5 = 0$$

Therefore, the conclusion is always **yes** regardless the value of
 $P(\mathbf{X} | \text{buys_computer} = \text{"yes"})$

Avoiding the zero-probability problem

- Laplacian correction (or Laplacian estimator)

$$P(C_i) = \frac{|C_i| + 1}{|D| + m} \quad P(x_k | C_i) = \frac{|x_k \cup C_i| + 1}{|C_i| + r}$$

- where m is the number of classes, $|x_k \cup C_i|$ denotes the number of tuples contains both $A_k = x_k$ and C_i , and r is the number of values of attribute A_k
- The “corrected” probability estimates are close to their “uncorrected” counterparts.

Naive Bayesian for the example dataset

| | |
|--------------------------|-------|
| P(buys_computer = "yes") | 10/16 |
| P(buys_computer = "no") | 6/16 |

| | buys_computer = "yes" | buys_computer = "no" |
|------------------------------------|-----------------------|----------------------|
| age = "<=30" | 3/12 | 4/8 |
| age = "31...40" | 5/12 | 1/8 |
| age = ">40" | 4/12 | 3/8 |
| income = "low" | 4/12 | 2/8 |
| income = "medium" | 5/12 | 3/8 |
| income = "high" | 3/12 | 3/8 |
| student = "yes" | 7/11 | 2/7 |
| student = "no" | 4/11 | 5/7 |
| credit_rating = "fair" | 7/11 | 3/7 |
| credit_rating = "excellent" | 4/11 | 4/7 |

Naive Bayesian for the example dataset

| age | income | student | credit_rating | buys_computer |
|--------|--------|---------|---------------|---------------|
| 31..40 | medium | yes | fair | ? |

$$P(\mathbf{X} | C_i)$$

$$P(\mathbf{X} | \text{buys_computer} = \text{"yes"}) = 5/12 * 5/12 * 7/11 * 7/11 = 0.070$$

$$P(\mathbf{X} | \text{buys_computer} = \text{"no"}) = 1/8 * 3/8 * 2/7 * 3/7 = 0.006$$

$$P(\mathbf{X} | C_i) * P(C_i)$$

$$P(\mathbf{X} | \text{buys_computer} = \text{"yes"}) * P(\text{buys_computer} = \text{"yes"}) = 0.044$$

$$P(\mathbf{X} | \text{buys_computer} = \text{"no"}) * P(\text{buys_computer} = \text{"no"}) = 0.002$$

$$P(C_i | \mathbf{X})$$

$$P(\text{buys_computer} = \text{"yes"} | \mathbf{X}) = 0.953$$

$$P(\text{buys_computer} = \text{"no"} | \mathbf{X}) = 0.047$$

Therefore, X belongs to class ("buys_computer = yes")

Handling missing values

- If the values of some attributes are missing, these attributes are omitted from the product of probabilities
- As a result, the estimation is less accurate
- For example,

| age | income | student | credit_rating | buys_computer |
|-----|--------|---------|---------------|---------------|
| ? | medium | yes | fair | ? |

Homework

| No. | Writable | Updated | Size | Class |
|-----|----------|---------|-------|----------|
| 1 | Yes | No | Small | Infected |
| 2 | Yes | Yes | Large | Infected |
| 3 | No | Yes | Med | Infected |
| 4 | No | No | Med | Clean |
| 5 | Yes | No | Large | Clean |
| 6 | No | No | Large | Clean |
