PROGRAMMING METHODOLOGY
(PHƯƠNG PHÁP LẬP TRÌNH)

UNIT 16: Characters and Strings

Acknowledgement

- The contents of these slides have origin from School of Computing, National University of Singapore.

- We greatly appreciate support from Mr. Aaron Tan Tuck Choy for kindly sharing these materials.

Policies for students

- These contents are only used for students PERSONALLY.
- Students are NOT allowed to modify or deliver these contents to anywhere or anyone for any purpose.

Recording of modifications

- Currently, there are no modification on these contents.

Unit 16: Characters and Strings

Objectives:

- Declare and manipulate data of char data type
- Learn fundamental operations on strings
- Write string processing programs

References:

- Lesson 1.4.1 Characters and Symbols
- Chapter 7: Strings and Pointers

Unit 16: Characters and Strings (1/2)
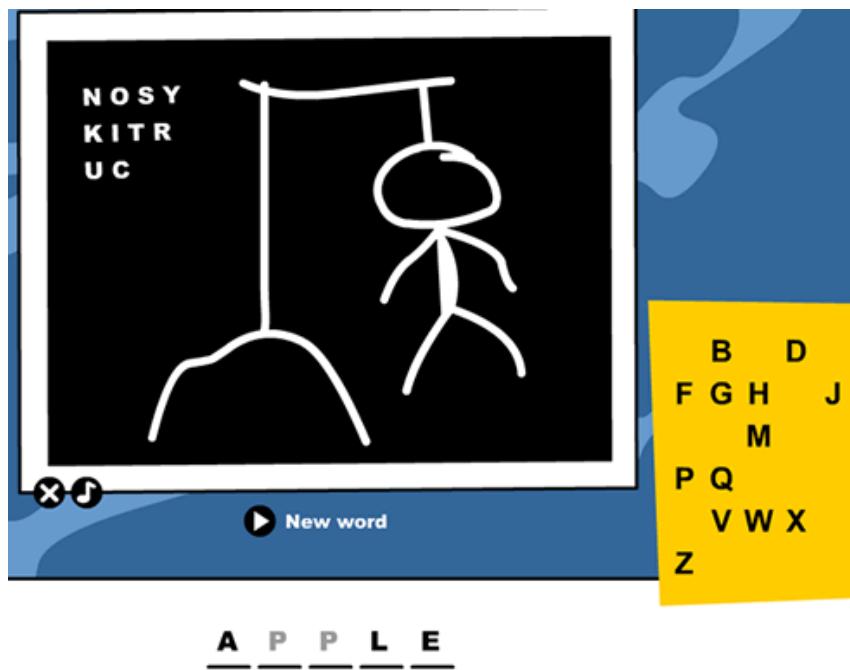

1. **Motivation**

2. **Characters**

     2.1   ASCII Table

     2.2   Demo #1: Using Characters

     2.3   Demo #2: Character I/O

     2.4   Demo #3: Character Functions

     2.5   Common Error

3. **Strings**

     3.1   Basics

     3.2   String I/O

     3.3   Demo #4: String I/O

   3.4   Demo #5: Remove Vowels

     3.5   Demo #6: Character Array without terminating '\0'

Unit 16: Characters and Strings (2/2)

4. String Functions

5. Pointer to String

6. Array of Strings

7. Demo #7: Using String Functions

8. Strings and Pointers

1. Motivation

- Why study characters and strings?

- Hangman game – Player tries to guess a word by filling in the blanks. Each incorrect guess brings the player closer to being "hanged"

- Let's play! http://www.hangman.no/

2. Characters

- In C, <u>single</u> characters are represented using the data type **char**

- Character constants are written as symbols enclosed in single quotes
  - Examples: **'g'**, **'8'**, **'*'**, **' '**, **'\n'**, **'\0'**
  - Recall: Week 3 Exercise #7 NRIC Check Code

- Characters are stored in one byte, and are encoded as numbers using the ASCII scheme.

- *ASCII* (*American Standard Code for Information Interchange*), is one of the document coding schemes widely used today.

- *Unicode* is another commonly used standard for multi-language texts.

2.1 Characters: ASCII Table

	0	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**
0	nul	soh	stx	etx	eot	enq	ack	bel	bs	ht
10	lf	vt	ff	cr	so	si	dle	dc1	dc2	dc3
20	cd4	nak	syn	etb	can	em	sub	esc	fs	gs
30	rs	us	sp	!	"	#	$	%	&	'
40	(	)	*	+	,	-	.	/	0	1
50	2	3	4	5	6	7	8	9	:	;
60	<	=	>	?	@	A	B	C	D	E
70	F	G	H	I	J	K	L	M	N	O
80	P	Q	R	S	T	U	V	W	X	Y
90	Z	[	\	]	^	_	`	a	b	c
100	d	e	f	g	h	i	j	k	l	m
110	n	o	p	q	r	s	t	u	v	w
120	x	y	z	{	}	|	~	del		

For example, character 'O' is 79 (row value 70 + col value 9 = 79).

2.2 Demo #1: Using Characters (1/2)

```c
// Unit16_CharacterDemo1.c
#include <stdio.h>

int main(void) {

    char grade = 'A', newgrade, ch;
    int value;

    printf("grade = %c\n", grade);
    newgrade = grade + 2;
    printf("newgrade = %c\n", newgrade);
    printf("newgrade = %d\n", newgrade);

    value = 65;
    printf("value = %d\n", value);
    printf("value = %c\n", value);
```

Unit16_CharacterDemo1.c

Declaring and initialising char variables.

Using %c

Relationship between character and integer.

```
grade = A
newgrade = C
newgrade = 67
```

```
value = 65
value = A
```

2.2 Demo #1: Using Characters (2/2)

Comparing characters.

```c
    if ('A' < 'c')
        printf("'A' is less than 'c'\n");
    else
        printf("'A' is not less than 'c'\n");

    for (ch = 'p'; ch <= 't'; ch++)
        printf("ch = %c\n", ch);

    return 0;
}
```

Using character variable as a loop variable.

```
'A' is less than 'c'
```

```
ch = p
ch = q
ch = r
ch = s
ch = t
```

ASCII value of 'A' is 65. ASCII value of 'c' is 99.

2.3 Demo #2: Character I/O

- Besides scanf() and printf(), we can also use getchar() and putchar(). Note how they are used below:

```
// Unit16_CharacterDemo2.c
#include <stdio.h>

int main(void) {
    char ch;

    printf("Enter a character: ");
    ch = getchar();

    printf("The character entered is ");
    putchar(ch);
    putchar('\n');

    return 0;
}
```

Unit16_CharacterDemo2.c

Read a character from stdin.

```
Enter a character: W
Character entered is W
```

Print a character to stdout.

2.4 Demo #3: Character Functions

- Must include <ctype.h> to use these functions.

Unit16_CharacterDemo3.c

```c
// Unit16_CharacterDemo3.c
#include <stdio.h>
#include <ctype.h>
int main(void) {
    char ch;

    printf("Enter a character: ");
    ch = getchar();
    if (isalpha(ch)) {
        if (isupper(ch)) {
            printf("'%c' is a uppercase-letter.\n", ch);
            printf("Converted to lowercase: %c\n", tolower(ch));
        }
        if (islower(ch)) {
            printf("'%c' is a lowercase-letter.\n", ch);
            printf("Converted to uppercase: %c\n", toupper(ch));
        }
    }
    if (isdigit(ch)) printf("'%c' is a digit character.\n", ch);
    if (isalnum(ch)) printf("'%c' is an alphanumeric character.\n", ch);
    if (isspace(ch)) printf("'%c' is a whitespace character.\n", ch);
    if (ispunct(ch)) printf("'%c' is a punctuation character.\n", ch);
    return 0;
}
```

Download this program and test it out.
For a complete list of character functions, refer to the Internet (eg: http://www.csd.uwo.ca/staff/magi/175/refs/char-funcs.html)

Note that tolower(ch) and toupper(ch) do NOT change ch!

2.5 Characters: Common Error

- A character variable named z does not means it is equivalent to 'z' or it contains 'z'!

```
char A, B, C, D, F;

if (marks >= 80)
    return A;
else if (marks >= 70)
    return B;
else if (marks >= 60)
    return C;
. . .
```
✗

```
if (marks >= 80)
    return 'A';
else if (marks >= 70)
    return 'B';
else if (marks >= 60)
    return 'C';
. . .
```
✓

```
char grade;
if (marks >= 80)
    grade = 'A';
else if (marks >= 70)
    grade = 'B';
else if (marks >= 60)
    grade = 'C';
. . .
return grade;
```
✓

3. Strings

- We have seen arrays of numeric values (types int, float, double)

- We have seen string constants
  - `printf("Average = %.2f", avg);`
  - `#define ERROR "*****Error -"`

- A string is an array of characters, terminated by a null character '\0' (which has ASCII value of zero)

c	s	1	0	1	0	\0

3.1 Strings: Basics

- Declaration an array of characters
  - `char str[6];`

- Assigning character to an element of an array of characters

e	g	g	\0	?	?

  - `str[0] = 'e';`
  - `str[1] = 'g';`
  - `str[2] = 'g';`
  - `str[3] = '\0';`

Without '\0', it is just an array of character, <u>not</u> a string.

- Initializer for string

Do not need '\0' as it is automatically added.

  - Two ways:
  - `char fruit_name[] = "apple";`
  - `char fruit_name[] = {'a','p','p','l','e','\0'};`

3.2 Strings: I/O (1/2)

- Read string from stdin
  - `fgets(str, size, stdin) // reads size – 1 char,`
  - `// or until newline`
  - `scanf("%s", str);  // reads until white space`

- Print string to stdout
  `puts(str);  // terminates with newline`
  `printf("%s\n", str);`

Note: There is another function gets(str) to read a string interactively. However, due to security reason, we avoid it and use fgets() function instead.

3.2 Strings: I/O (2/2)

- fgets()
  - On interactive input, fgets() also reads in the newline character

        User input: **eat**

        | e | a | t | \n | \0 | ? | ? |

  - Hence, we may need to replace it with '\0' if necessary

    ```
    fgets(str, size, stdin);
    len = strlen(str);
    if (str[len – 1] == '\n')
        str[len – 1] = '\0';
    ```

3.3 Demo #4: String I/O

Unit16_StringIO1.c

```c
#include <stdio.h>
#define LENGTH 10

int main(void) {
    char str[LENGTH];

    printf("Enter string (at most %d characters): ", LENGTH-1);
    scanf("%s", str);
    printf("str = %s\n", str);
    return 0;
}
```

Test out the programs with this input:
My book

Output:
str = My

```c
#include <stdio.h>
#define LENGTH 10

int main(void) {
    char str[LENGTH];

    printf("Enter string (at most %d characters): ", LENGTH-1);
    fgets(str, LENGTH, stdin);
    printf("str = ");
    puts(str);
    return 0;
}
```

Output:
str = My book

Unit16_StringIO2.c

Note that puts(str) adds a newline automatically.

3.4 Demo #5: Remove Vowels (1/2)

- Write a program Unit16_RemoveVowels.c to remove all vowels in a given input string.

- Assume the input string has at most 100 characters.

- Sample run:

```
Enter a string: How HAVE you been, James?
Changed string: Hw HV y bn, Jms?
```

3.4 Demo #5: Remove Vowels (2/2)

Unit16_RemoveVowels.c

```c
#include <stdio.h>
#include <string.h>
#include <ctype.h>
int main(void) {
    int i, len, count = 0;
    char str[101], newstr[101];

    printf("Enter a string (at most 100 characters): ");
    fgets(str, 101, stdin); //what happens if you use scanf() here?
    len = strlen(str); // strlen() returns number of char in string
    if (str[len - 1] == '\n')
        str[len - 1] = '\0';
    len = strlen(str); // check length again

    for (i=0; i<len; i++) {
        switch (toupper(str[i])) {
            case 'A': case 'E':
            case 'I': case 'O': case 'U': break;
            default: newstr[count++] = str[i];
        }
    }
    newstr[count] = '\0';
    printf("New string: %s\n", newstr);
    return 0;
}
```

Need to include <string.h> to use string functions such as strlen().

3.5 Demo #6: Character Array without terminating '\0'

- What is the output of this code?

Unit16_without_null_char.c

```c
#include <stdio.h>
#include <string.h>

int main(void) {
  char str[10];

  str[0] = 'a';
  str[1] = 'p';
  str[2] = 'p';
  str[3] = 'l';
  str[4] = 'e';

  printf("Length = %d\n", strlen(str));
  printf("str = %s\n", str);

  return 0;
}
```

One possible output:
Length = 8
str = apple¿ø<

Compare the output if you add:
str[5] = '\0';

or, you have:
char str[10] = "apple";

printf() will print %s from the starting address of str until it encounters the '\0' character.

! %s and string functions work only on "true" strings. Without the terminating null character '\0', string functions will not work properly.

4. String Functions (1/3)

- C provides a library of string functions
  - Must include <string.h>
  - Table 7.3 (pg 509 – 514)
  - http://www.edcc.edu/faculty/paul.bladek/c_string_functions.htm
  - http://www.cs.cf.ac.uk/Dave/C/node19.html
  - and other links you can find on the Internet
- strcmp(s1, s2)
  - Compare the ASCII values of the corresponding characters in strings s1 and s2.
  - Return
    - a negative integer if s1 is lexicographically less than s2, or
    - a positive integer if s1 is lexicographically greater than s2, or
    - 0 if s1 and s2 are equal.
- strncmp(s1, s2, n)
  - Compare first n characters of s1 and s2.

4. String Functions (2/3)

- ## strcpy(s1, s2)
  - Copy the string pointed to by s2 into array pointed to by s1.
  - Function returns s1.
  - Example:

    ```
    char name[10];
    strcpy(name, "Matthew");
    ```

M	a	t	t	h	e	w	\0	?	?

  - The following assignment statement <u>does not work</u>:

    ```
    name = "Matthew";
    ```

  - What happens when string to be copied is too long?

    ```
    strcpy(name, "A very long name");
    ```

A		v	e	r	y		l	o	n	g		n	a	m	e	\0

- ## strncpy(s1, s2, n)
  - Copy first n characters of string pointed to by s2 to s1.

4. String Functions (3/3)

- strstr(s1, s2)
    - Returns a pointer to the first instance of string s2 in s1.
    - Returns a NULL pointer if s2 is not found in s1,

- We will use the functions above in Demo #7.

- Read up on the above functions (Table 7.3 [pg 405 – 411] and Table 7.4 [pg 412 – 413])
    - We will do some more exercises on them next week

- Other functions (atoi, strcat, strchr, strtok, etc.)
    - We will explore these in your discussion session

5. Pointer to String (1/2)

```c
#include <stdio.h>
#include <string.h>
int main(void) {
    char name[12] = "Chan Tan";
    char *namePtr = "Chan Tan";

    printf("name = %s\n", name);
    printf("namePtr = %s\n", namePtr);
    printf("Address of 1st array element for name = %p\n", name);
    printf("Address of 1st array element for namePtr = %p\n",namePtr);

    strcpy(name, "Lee Hsu");
    namePtr = "Lee Hsu";

    printf("name = %s\n", name);
    printf("namePtr = %s\n", namePtr);
    printf("Address of 1st array element for name = %p\n", name);
    printf("Address of 1st array element for namePtr = %p\n",namePtr);
}
```

name is a character array of 12 elements.
namePtr is a pointer to a character.
Both have strings assigned.
Difference is name sets aside space for 12 characters, but namePtr is a char pointer variable that is initialized to point to a string constant of 9 characters.

name updated using strcpy().
namePtr assigned to another string using =.

Address of first array element for name remains constant, string assigned to namePtr changes on new assignment.

Unit16_StringPointer.c
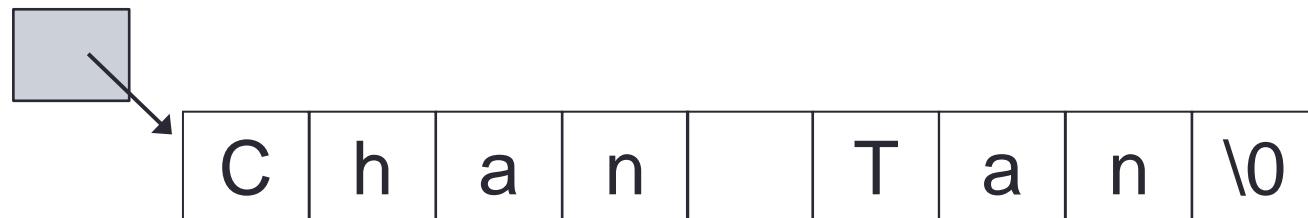

5. Pointer to String (2/2)

- Comparison

char name[12] = "Chan Tan";

name[0]   [1]   [2]   [3]   [4]   [5]   [6]   [7]   [8]   [9]   [10]   [11]

C	h	a	n		T	a	n	\0	\0	\0	\0

char *namePtr = "Chan Tan";

namePtr

C	h	a	n		T	a	n	\0

6. Array of Strings

- ## Declaration

  ```
  char fruits[MAXNUM][STRSIZE];
  // where MAXNUM is the maximum number of names
  // and STRSIZE is the size of each name
  ```

- ## Initialization

  ```
  char fruits[][6] = {"apple", "mango", "pear"};
  ```
  or
  ```
  char fruits[3][6] = {"apple", "mango", "pear"};
  ```

- ## Output

  ```
  printf("fruits: %s %s\n", fruits[0], fruits[1]);
  printf("character: %c\n", fruits[2][1]);
  ```

  ```
  fruits: apple mango
  character: e
  ```

7. Demo #7: Using String Functions

```c
#include <stdio.h>
#include <string.h>
#define MAX_LEN 10
int main(void) {
    char s1[MAX_LEN + 1], s2[MAX_LEN + 1], *p;
    int len;

    printf("Enter string (at most %d characters) for s1: ", MAX_LEN);
    fgets(s1, MAX_LEN+1, stdin);
    len = strlen(s1);
    if (s1[len - 1] == '\n') s1[len - 1] = '\0';

    printf("Enter string (at most %d characters) for s2: ", MAX_LEN);
    fgets(s2, MAX_LEN+1, stdin);
    len = strlen(s2);
    if (s2[len - 1] == '\n') s2[len - 1] = '\0';

    printf("strcmp(s1,s2) = %d\n", strcmp(s1,s2));

    p = strstr(s1,s2);
    if (p != NULL) printf("strstr(s1,s2) returns %s\n", p);
    else printf("strstr(s1,s2) returns NULL\n");

    strcpy(s1,s2);
    printf("After strcpy(s1,s2), s1 = %s\n", s1);
    return 0;
}
```

Unit16_StringFunctions.c

8. Strings and Pointers (1/4)

- We discussed in Unit #9 Section 4 that an array name is a pointer (that points to the first array element)

- Likewise, since a string is physically an array of characters, the name of a string is also a pointer (that points to the first character of the string)

Unit16_String_vs_Pointer.c

```c
char str[] = "apple";

printf("1st character: %c\n", str[0]);
printf("1st character: %c\n", *str);

printf("5th character: %c\n", str[4]);
printf("5th character: %c\n", *(str+4));
```

```
1st character: a
1st character: a
5th character: e
5th character: e
```

8. Strings and Pointers (2/4)

- Unit16_strlen.c shows how we could compute the length of a string if we are not using strlen()
- See full program on CS1010 website

Unit16_strlen.c

```c
int mystrlen(char *p) {
  int count = 0;

  while (*p != '\0') {
    count++;
    p++;
  }

  return count;
}
```

8. Strings and Pointers (3/4)

- Since ASCII value of null character '\0' is zero, the condition in the while loop is equivalent to $(*p != 0)$ and that can be further simplified to just $(*p)$ (see left box)

- We can combine *p with p++ (see right box) (why?)

```c
int mystrlen(char *p) {
  int count = 0;

  while (*p) {
    count++;
    p++;
  }

  return count;
}
```

```c
int mystrlen(char *p) {
  int count = 0;

  while (*p++) {
    count++;
  }

  return count;
}
```

Unit16_strlen_v2.c

8. Strings and Pointers (4/4)

- How to interpret the following?

while (*p++)

Check whether *p is 0 (that is, whether *p is the null character '\0')…

Then, increment p by 1 (so that p points to the next character).
Not increment *p by 1!

(*p++) is <u>not</u> the same as **(*p)++**

(*p)++ is to increment *p (the character that p points to) by 1. (Hence, if p is pointing to character 'a', that character becomes 'b'.)

Extra topics

- 2 additional topics that are not in the syllabus are in the file Unit16_Extra.pptx

  - Array of Pointers to Strings

  - Command-line arguments

Summary

- In this unit, you have learned about

  - Characters
    - Declaring and using characters
    - Characters I/O
    - Character functions

  - Strings
    - Declaring and initialising strings
    - String I/O
    - String functions
    - Array of strings

End of File
